1 Introduction

T_EXShop is a "Front End" for a T_EX distribution on Mac OS X. As such it allows the user to create and edit T_EX source files, interact with the T_EX distribution (e.g., typeset the source file) and finally preview the final pdf file. It also allows the user to go back and forth between preview and source.

Over the years TEXShop has added many features. Some of them are obvious and are meant to help a novice get started. Others are a bit more subtle in their use and the underlying power of these features needs to be coaxed out.

1.1 What Isn't Here

This article is, first of all, *not* about T_EX or L^AT_EX. I don't intend to teach you how to write T_EX source. There are many fine books and articles that will teach you how to become a T_EXpert or, at least, a T_EXpätzer like me.

Although there is some introductory material it is also *not* meant as a complete manual for the use of TEXShop for the total novice. Over time it might evolve into such a document but I've got to start somewhere and this is that start.

1.2 What Is Here

In this article I hope to introduce you to some of the more subtle things you can do to make your life as a TEX source editor easier. These include adding keyboard commands and extending the editing capabilities of TEXShop; helping you make short(er) work of creating documents, etc., with the use of Macros and Command Completion; and, finally, how one can extend the processing capabilities of TEXShop using Engines.

2 Editing, Typesetting and Viewing — the Work Cycle

This is about as close to a beginner's section you will get in this document.

The usual cycle for producing a document with TEXShop is: first, edit the Source document, entering necessary codes for the typesetting phase; second, typeset the edited document and; third, examine the resulting pdf file. You may have to return to editing the document after attempting to typeset if errors are detected during the typeset phase. You will almost always cycle through these stages multiple times.

2.1 Editing the Source File

The first thing you've got to do to create that great work is to type it into the source document that will be typeset and viewed later. This involves both putting LETEX markup as well as your wonderful words into the document.

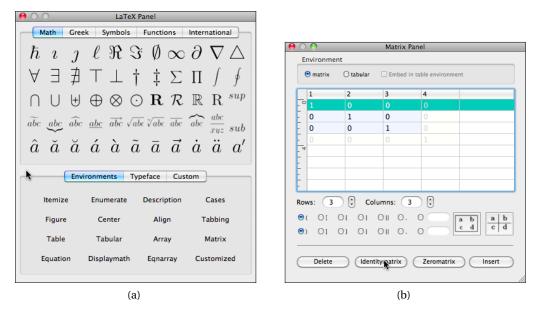

Figure 1: (a) The LaTeX Panel; and (b) Matrix Panel.

To get started you can open a new document using File → New (Cmd-N) and then fill in the start of a new document by choosing a template from the Templates popup menu in the Source Window or use the File → New From Stationery... command and picking appropriate Stationery from the list. Note that the templates and stationery provided are certainly not complete; if you have some that you think are of general use feel free to submit them for inclusion in Texshop. You can add personal Templates and Stationery to ~/Library/Texshop/Templates and ~/Library/Texshop/Stationery respectively. Note: In Texshop 3.58 and later you can use the Texshop → Open ~/Library/Texshop Menu item to open that folder in Finder. Note: ~/Library is the Library folder in your HOME folder; not /Library, the Library folder at the root of your Hard Drive. Note: Under Mac Os x 10.7 and later the Library folder is "hidden" by default; in Finder hold the Opt key down and click on the Go menu and it will be available. Under Os x 10.9 and later you can permanently show ~/Library in your HOME folder by opening and selecting your HOME folder, choosing View → Show View Options (Cmd-J) in Finder and then checking Show Library Folder.

Stationary is meant to be a skeleton for a complete, new document while a Template can be added at any point in a document so may just contain fragments that may be useful as additions to certain documents; e.g., specific entries for certain packages that may only be needed in a particular document. On the other hand, a Template may also contain the skeleton for a complete new document for a particular use; that's the way I tend to use them.

2.1.1 Land Matrix Panels

While I believe that panels with a clickable interface actually hinder learning I'll mention that TEXShop has two panels: one to help with entering LTEX code (the LTEX Panel) and one for setting up the basic structure of a matrix or tabular (the Matrix Panel). These are toggled on/off under the Window Menu. Figure (1) shows what the panels look like.

It is possible to make a few changes and additions to the LaTeX Panel by editing the ~/Library/ TeXShop/LatexPanel/completion.plist file. **Note: all plist files must be edited using UTF-8 Unicode encoding.**

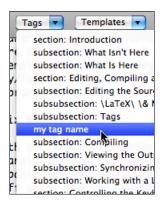

Figure 2: The Tags Popup Menu.

2.1.2 The Tags Popup

The Tags popup menu on the Source Toolbar will automatically list sectioning commands so you can quickly jump to a relevant part of your document source. You can add your own tag to the list at a particular place in the document by placing the line

%:my tag name

at that position and it will then appear in the popup list so you can jump to that location quickly. See Figure (2). Sorry, tags are not recursively included for files you \include or \input.

2.1.3 Find/Replace

There are three Find/Replace "panels" available with $T_EXShop 3.xx$ (two with $T_EXShop 2.xx$). Each is discussed individually below. You choose the Find/Replace Panel you wish to use on the Source tab under $T_EXShop \rightarrow Preferences$. You must restart T_EXShop to enable any changes made to the Find/Replace Panel choice in Preferences.

Apple Find Panel The traditional Apple Find/Replace panel. A simple to use panel for finding and replacing text. The Standard Apple Find/Replace Panel is shown in Figure (3a) on page 5.

OgreKit Find Panel An advanced Find/Replace panel that supports Regular Expressions (regex for short) of various styles (press the More Options button to select the dialect). Regex is a very advanced way to find and replace text and is a good investment of your time to learn. The OgreKit Find Panel with the More Options panel displayed is shown in Figure (3b) on Page 5.

Apple Find Bar Only available in OS X 10.7 and later; and therefore only in TEXShop 3.xx. It provides a drop down bar for doing Find with an additional line if you select Replace. See Figure (3c) on page 5 for an example of the Apple Find Bar; the additional Replace line is displayed.

2.1.4 Spell Checking

By default TEXShop allows you to use Apple's Spell Checker as built into most applications. Unfortunately that Spell Checker doesn't know anything about LATEX commands so there is a tendency to flag those commands as misspelled words. There are several Spell Check applications that are LATEX-aware with the two most popular being Excalibur (maintained by Rick Zaccone, currently

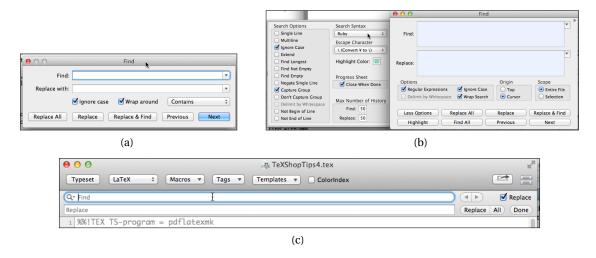

Figure 3: The Find/Replace "panels" available in TEXShop: (a) the standard Apple Find Panel; (b) the Ogrekit Find Panel with the More Options panel displayed; and, (c) the Apple Find Bar available with TEXShop 3.xx.

at version 4.07 and installed in /Applications/TeX/Excalibur by the MacT_EX install package) and cocoAspell (by Anton Leuski and currently at version 2.5 for El Capitan and later) which installs a Spelling Preference Pane in System Preferences. More information about these two Spell Checkers is found below.

If you use different dictionaries for different documents (e.g., English or German depending upon the document) you can have TEXShop automatically choose the proper dictionary on a document by document basis by placing a line like

% !TEX spellcheck = English

(for the English (Aspell) dictionary in this case) near the top of each document. Search for 'checking spelling' (without the quotes) in T_EXShop 's $Help \rightarrow TeXShop$ Help Panel. . . for more detailed information on the designation of a particular dictionary.

Excalibur The Excalibur Spell Checker is a stand-alone application that reads in a Source file, allows you to run a spell check which you then Save as a modified Source file; TEXShop automatically picks up the changes in that Source file. There are several versions of Macros that allow you to run Excalibur from within TEXShop. One by Michael Sharpe (with minor modifications by H. Schulz) can be downloaded from https://herbs.github.io as TeXShopExcaliburMacro.zip. With any of those macros TEXShop automatically picks up the spell checked and saved version of the Source file and *replaces* the old contents of the displayed Source document by the spell checked version; any changes you make to the Source file while Excalibur is still correcting the document *will be lost* so don't do that!

More dictionaries for Excalibur are available at http://excalibur.sourceforge.net>.

cocoAspell The cocoAspell Spell Checker integrates itself into the Apple Spell Check system. After enabling it and choosing the active dictionaries from the installed Spelling Preference Pane in System Preferences you can choose one to use within T_EXShop by using $Edit \rightarrow Show$ Spelling and Grammar (Cmd-:) and choosing an Aspell dictionary. You must Quit and Restart T_EXShop if you wish to make that dictionary the default.

Figure 4: The Default (4a) and an alternate set (4b) of Syntax Colors in T_FXShop.

Information on obtaining and installing more dictionaries for cocoAspell is available at <http://people.ict.usc.edu/~leuski/cocoaspell/>. Version 2.5 of cocoAspell installs and works properly with macOS versions El Capitan, Sierra and later.

2.1.5 "Hiding" Index Commands

Indexing commands tend to duplicate information that is part of the text and therefore interfere with the process of comprehending the text itself. It is possible to have T_EXShop colorize \index commands in a bright yellow. To do that you need to add a 'ColorIndex' checkbox to the Source window's Toolbar. With the Source window active you can either Right-Click (or Ctl-Click) on the Toolbar, choose Customize Toolbar..., or Window \rightarrow Customize Toolbar..., and Drag and Drop the ColorIndex checkbox to a place on the Toolbar. Checking that box will make all \index{text} commands turn a bright yellow, by default, and "recede" into the background; see Figure (4a) on page 6.

2.1.6 Syntax Coloring

TEXShop provides Syntax Coloring for TEX documents as an aid to pick out text versus markup in source documents. To activate the Syntax Coloring make sure that Syntax Coloring is checked in TeXShop \rightarrow Preferences \rightarrow Source \rightarrow Editor. The default color scheme is a bright red for comments, a dark blue for commands and a dark green for "marker" characters ($\{$, $\}$ and \$); see Figure (4a) on page 6. In addition, as noted in section (2.1.5) above, TeXShop offers a special Syntax Coloring for \index commands so that they "recede" into the background and you can more easily read the surrounding text.

You may not like the default Syntax Coloring scheme. Searching for 'syntax colors' (without the quotes) in TeXShop's Help Panel gives information on how to change the colors for comments, commands and "marker" characters. It is also possible to change the color of \index commands from the default bright yellow to some other color. The corresponding hidden preference variables are indexred, indexgreen and indexblue. See Figure (4b) on page 6 for an example. (If you like those adjusted syntax colors you can download TeXShopSyntaxColors.zip from <https://herbs.github.io>. You can also edit those scripts to create colors you prefer.)

2.1.7 Line Numbers

It is sometimes handy to show line numbers to the left of your Source document. Errors and warnings shown in the Console window during typesetting give the File Name and Line Number in the proper Source file. To turn on Line Numbering by default check the Line Numbers box in the Editor section of the Source pane in TeXShop \rightarrow Preferences. You can use Source \rightarrow Show Line Numbers (Ctl-Cmd-L) to toggle Line Numbering on/off for a particular document. There is also an Edit \rightarrow Line Number. . . Menu Item which will prompt for a line number and then jump to that location.

Note: Lines are defined to be bounded by typed Return characters so a softwrapped paragraph will count as a single line.

2.2 Typesetting

Once you are ready to take a look at how your document will appear you typeset it with the default engine, pdflatex out of the box, by simply using the Typeset \rightarrow Typeset (Cmd-T) command.

You may wish to use a different engine as your default. You can change the default engine in TeXShop \rightarrow Preferences \rightarrow Typesetting.

If you use the pstricks package extensively or include many eps graphics files in your document you may wish to typeset using $latex \rightarrow dvips \rightarrow ps2pdf$ since pdf(la) tex does not allow for direct inclusion of eps files¹. The easiest way to do this is to include the line

```
% !TEX TS-program = latex
```

at the top of your document. Then TEXShop will use the latex+distiller typesetting method noted above no matter what the default engine setting. Change latex to pdflatex to force use of pdflatex to typeset your file.

2.2.1 Removing "Aux" files

The process of typesetting produces several auxiliary files that contain information about cross references, bibliography, indexes, etc. If an error occurs during typesetting these files can be left in some unknown state and need to to be removed before attempting to typeset the document again. The File \rightarrow Trash Aux Files (Ctl-Cmd-A) command removes most of the files that may create problems.

With $T_EXShop 3.22$ and later there is an additional way to remove those files and then typeset the document with a single command. If you hold the Opt key down while clicking the Typeset menu the Typeset \rightarrow Typeset command becomes Typeset \rightarrow Trash Aux & Typeset (Opt-Cmd-T).

Search for 'trash aux' in Help \rightarrow TeXShop Help Panel... for the list of all file extensions removed by the Trash Aux Files and Trash Aux & Typeset menu commands. The Terminal commands used to add additional extensions to the trash list and return the list to the default list of extensions is also given in that section of TeXShop's Help Panel.

2.2.2 Experimenting

Version 3.37 and later of T_EXShop has an Edit → Experiment... menu item. Clicking on that item, with a Source file open, opens a new, resizable "Experiment" window which allows you to enter text. When you click the Typeset button on that window T_EXShop will use the preamble from your open Source file and typeset the text in the Experiment window, opening a special Preview window to show the result. Great for experimenting with a figure to get it just right, etc.

2.2.3 Dealing with Errors

Figure (5) on page 8 shows the Console Window which appears when you typeset a file. The Console tab of TeXShop \rightarrow Preferences allows you to change the background and foreground (character) colors² along with some other preferences.

If your typeset run comes across an error it will stop and wait for input which is done on the bottom line. If you wish to end the typeset run you can click on the Abort button. Click on the Goto Error (Ctl-Cmd-E) to move to the error location in the proper Source file. Understand that your typesetting run gives an error when it finally figures out there is an unrecoverable error but

¹The pdflatex program in MacT_FX-2010 and later will do on-the-fly conversion of eps files.

²I've chosen colors that correspond to my ancient Heathkit Terminal.

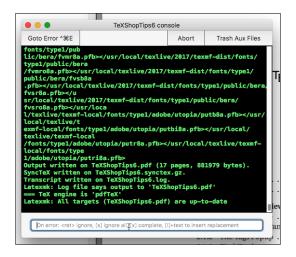

Figure 5: Console Window

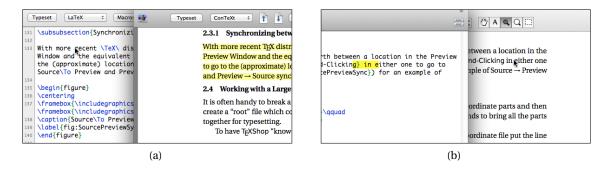

Figure 6: (a) Source \rightarrow Preview Synchronization; and (b) Preview \rightarrow Source Synchronization.

that error may be much earlier in your Source file. Also, make sure to read Section (2.4) to properly set up the files in a distributed document.

2.3 Viewing the Output pdf File

Assuming the document was successfully typeset the pdf file will automatically open in a separate preview window.

You can control how it's displayed in the Preview Menu. You can change the default settings in TeXShop \rightarrow Preferences \rightarrow Preview.

2.3.1 Synchronizing between pdf and Source

With more recent T_EX distributions you can also skip back and forth between a location in the Preview Window and the equivalent location in the Source Window by Cmd-Clicking in either one to go to the (approximate) location in the other. See Figure (6) for an example of Source \rightarrow Preview and Preview \rightarrow Source synchronization.

2.4 Working with a Large Document

It is often handy to break a large document into more manageable subordinate parts and then create a "root" file which contains the preamble and \include commands to bring all the parts together for typesetting.

To have TEXShop "know" which file to typeset when working on a subordinate file put the line

Figure 7: BibDesk Plugin: (a) citation insertion; and (b) cross-reference insertion.

% !TEX root = path/to/rootfile.tex

at the top of your subordinate file; path/to/rootfile.tex is the relative or absolute path to the root file for this document. Once this is done T_EXShop will typeset the root file if you press Typeset → Typeset (Cmd-T) even though you are editing a subordinate file and properly synchronize between the Source and pdf. E.g., if the root file is called mygreatbook.tex and the chapter files, chapter1.tex, etc., are in a chapters sub-folder below the root file then place the line

```
% !TEX root = ../mygreatbook.tex
```

at the top of each of the chapter files. The ../ means go up one folder level to find the root file.

2.4.1 Switching between Source Windows

If you have multiple source files open you can switch between just those windows by using the Window → Next/Previous Source Window (Cmd-F2/Shft-Cmd-F2) menu commands.

2.5 Working with BibDesk and Citations

TEXShop has a built-in "plugin" that interacts with the BibDesk bibliography application to allow you to complete citation references in the \cite command. To enable the use of the "plugin" make sure that TeXShop \rightarrow Preferences \rightarrow Source \rightarrow Editor \rightarrow BibDesk Completions is checked.

To use it you must first open the required bibliography (bib) file(s) in BibDesk. Enter several characters from the reference label within the \cite command and press F5 to get a list of matching references from the bib file(s) with a bit of information about each one. Scroll to the one you want and press Return or Tab. See Figure (7) on page 9 for an example.

The "plugin" also works for entering cross-references within \ref or \pageref commands but only for those with labels in the file you are editing.

2.6 Getting Help for Packages

There are many times when having help about a given package can be handy. TeXShop has an interface to texdoc which will bring up that documentation. Execute Help \rightarrow Show Help for Package... (Opt-Cmd-I) and enter the name of the package.

You can also easily look at a package directly with the $Help \rightarrow Open Style File...$ command and enter the full package file name *including the proper extension* (e.g., .sty for packages or .cls for document classes).

3 Controlling the Keyboard

One of the best ways to speed up your entry of text in a source file is to keep your hands on the keyboard as much as possible—only one of the reasons I don't like the "clicky" interface of the

Let X and Matrix Panels. There are many shortcuts associated with the TeXShop menu system but this section is about changing and adding others and other keyboard customizations.

3.1 Menu Shortcuts & System Preferences

Sometimes you'd like to add a shortcut to a menu item that doesn't have one or add one to a command whose shortcut you dislike. Mac OS X 10.4 (Tiger) and later have a method to add shortcuts to specific menu items both globally and in specific programs. This feature has become much more reliable in OS X 10.5 and especially in OS X 10.6 and later.

One example using Mac OS X 10.6 (Snow Leopard) or later: $T_EXShop 2.36$ has added a File \rightarrow New from Stationery... command, without a shortcut, which can be very helpful once you set up stationery the way you want. To add Opt-Cmd-N as the shortcut to that menu item: open up the System Preferences application to Keyboard \rightarrow Keyboard Shortcuts (just Shortcuts in Mavericks) and select Application Shortcuts (App Shortcuts in Mavericks); press the + button to add a shortcut; select T_EXShop as the application; enter the exact menu title [New from Stationery...—note you *must* enter a real ellipsis, '...', (Opt-; with the English keyboard layout)]; and press Opt-Cmd-N as the shortcut.

Note: If you don't like a particular shortcut to a menu item you can usually change it to something that suits you better using the same technique used above.

3.2 More Editing Help

TEXShop is built using Apple's programmers interfaces (called frameworks) and therefore inherits all the properties and functionality of those interfaces. There are many things available through the Text framework that aren't tied to the keyboard by default, e.g., many 'emacs-like' keyboard commands, but Apple has made it possible to add those commands to all applications that use the Text framework; e.g., TextEdit and Mail as well as TEXShop.

This is done by creating a special file, DefaultKeyBinding.dict, and placing it in a particular location, ~/Library/KeyBindings (you may have to create the KeyBindings folder there if it doesn't already exist).

You can get more information about this, as well as a (useful) sample, by downloading the KeyBindings.zip file at https://herbs.github.io.

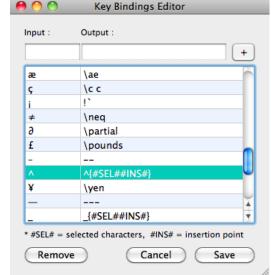

3.3 Key Bindings

Besides adding shortcuts to Menu Items you can actually bind keystrokes, within T_EXShop , to expand into groups of characters. Checking the $T_EXShop \rightarrow Preferences \rightarrow Source \rightarrow Editor \rightarrow Key$ Bindings option will enable this feature. You can also toggle it on/off for any particular document using the $Source \rightarrow Key$ Bindings $\rightarrow Toggle$ On/Off Menu Item. This feature was previously called Auto Completion; not to be confused with Command Completion—see section (5) below. Note: this facility only works with code generated by a single keystroke (possibly obtained by pressing multiple keys at once rather than in sequence); e.g. it won't work with é on the US keyboard since that is generated by the two keystroke sequence (Opt-e e).

E.g., pressing Opt-, with a US keyboard layout, usually enters \leq into your document but with Key Binding enabled \leq will be entered. Similarly, with some text selected pressing " will surround the selected text with '' and ''.

You can add, remove or change the key bindings using the Key Bindings Editor (Source \rightarrow Key Bindings \rightarrow Edit Key Bindings File...). Figures (8) and (9) show the Key Bindings Menu and Editor.

Once in the Editor the left hand column displays the input keystroke while the right hand column shows what will be substituted for that keystroke. To see how you produce some of those keystrokes enable the Keyboard Viewer in System Preferences \rightarrow Keyboard \rightarrow Keyboard by

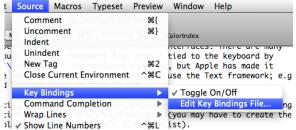

Figure 8: The Key Bindings Menu.

Figure 9: The Key Bindings Editor.

checking the 'Show Keyboard & Character Viewers in menu bar' item and then clicking on the new keyboard icon in your Menu Bar.

4 Macros

Macros can be simple text substitutions or Applescript programs that can do all sorts of processing on a file. You can also assign a keyboard shortcut to any macro for direct execution. The ones that are part of T_FXShop are found under the Macros Menu.

You can remove or add additional macros to the menu by using the Macro Editor (use the Macros \rightarrow Open Macro Editor command). The Macro Editor window and extra menu items in the Macros Menu when the Editor is open are shown in Figures (10) and (11) respectively.

Besides writing your own macros you can add macros supplied by others to the Macros menu one of two ways: copy and paste the text version of the macro into a New Item in the Macro Editor; or obtain the macro as a plist file and use the Add macros from file... command found in the Macros Menu when the Macro Editor is open (again, see Figure (11)).

More information on macros can be found by searching for macros in Help \rightarrow TeXShop Help Panel. . . .

4.1 Text Macros

Text macros are simple text substitutions. You can also tell TeXShop to insert any selected text using #SEL#, place the cursor using #INS# and even put in multiple lines in the macro itself. Then you can assign the text macro to a keyboard shortcut.

I like to use Cmd-B and Cmd-I to insert $\text{Lextbf}\{\dots\}$ and $\text{lemph}\{\dots\}$ into the document where \dots is any possible selected text. Macros to do that are already under the Macros \to Text Styles Menu so we need only assign keyboard shortcuts to them. To assign Cmd-I to the emphasize macro: open the Macro Editor where the form of the Macros menu appears in the left hand pane; click the emphasize macro found under Text Styles; click the Key insertion box and simply insert a lower case 'i' (the Cmd key is assumed and additional modifier keys can be checked off).

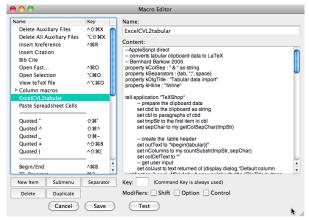

Figure 10: The Macro Editor Window.

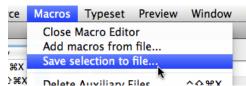

Figure 11: The extra menu items when the Macro Editor is open.

4.2 Applescript Macros

You cannot distinguish Applescript macros in the Macros Menu from text macros but they can do complicated processing and add/change the source file in TEXShop. One example in the default set is the Program macro that creates a

% !TEX TS-program = xxxx

line at the top of a file with your choice of engine substituted for xxxx. You can look at the Applescript code for this macro by clicking on its name in the Macro Editor.

Some detailed tips on creating Applescript Macros for use in T_EXShop can be found in the Help \rightarrow Notes on Applescript in TeXShop document by Michael Sharpe.

5 Command Completion

Let X markup is rather wordy which is nice because it describes what it's supposed to do but a bit painful to write. Command Completion allows you to insert complete environments and commands with a few keystrokes and the press of a "trigger" key (this is Esc by default but can be changed to Tab in TeXShop \rightarrow Preferences \rightarrow Source \rightarrow Command Completion Triggered By:).

Commands that have arguments usually have a Mark (\bullet) inserted for each argument. You move to the next argument by using the Source \rightarrow Command Completion \rightarrow Marks \rightarrow Next Mark command (Ctl-Cmd-F [or Opt-Trigger]). This also selects the Mark so typing automatically removes the Mark and substitutes the typed information. See the complete documentation, with lists of commands/abbreviations supplied with TeXShop out of the box, in the \sim /Library/TeXShop/CommandCompletion folder for much more information. The complete list of completions is available in Appendix A, starting on page (15).

5.1 Completions

You can complete many commands by starting to type them and pressing the trigger key. Variations on the commands with differing numbers of optional arguments are generated by additional presses of the trigger. One example: typing \sec and then the trigger on a new line produces

\section{•}

while a second press of the trigger gives

```
\section*{•}
```

the *-variant of the command and a final press of the trigger gives

\section[•]{•}

with the optional argument.

5.2 Substitutions or Abbreviations

Besides completions for partial command insertions there are also many abbreviations. These are short mnemonics for complete substitutions.

All abbreviations for environments start with a 'b'. To generate a complete itemize environment place \bite on a line by itself and press the trigger key to get

\begin{itemize}

\item

\end{itemize}•

with an extra Mark at the end so you can easily jump to the end of the environment. Additional items can be generated by typing \it and the trigger to get

\item

ready for entry of text.

In addition to the \section command lower level sectioning commands have abbreviations. Sub-sections can be generated by typing \ssec and the trigger to get

```
\subsection{•}
```

with subsequent presses of the trigger key giving the *-variant and finally the variant with the optional argument.

As a final example \tt and the trigger gives the \texttt{•} command and a second press of the trigger gives the declaration \ttfamily with similar results for other font changing commands.

A set of tables for all the completions and abbreviations supplied with T_EXShop can be found in Appendix A on page 15.

5.3 But Typing \ is Difficult

Some keyboard localizations make it difficult to type '\' directly; e.g., it takes multiple keystrokes to do so using the French keyboard localization. Hope isn't lost! In most cases an abbreviation or start of command doesn't have to start with a '\' but rather any 'white space character' (i.e., the start of a fresh line, a space or tab). So instead of

\sec

and the trigger key to produce

\section{•}

you can use

sec

at the start of a line and the trigger key to produce the same completed command.

Similarly, writing tt and the trigger will give \texttt{•} since it is preceded by a space character. However 'tt will *not* work since the tt *isn't* preceded by a 'white space character'; in that case you will have to use '\tt. The simplest way to make that easier is to create a macro that does nothing but insert a '\' (without the quotes) and assign it to a simple Cmd based keystroke.

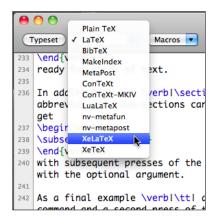

Figure 12: The Engines Popup Menu on the Source Toolbar.

5.4 Hey, it doesn't work!

If these examples don't work you probably need to let T_EXShop update the \sim /Library/TeXShop/CommandCompletion folder; simply delete that folder from \sim /Library/TeXShop and restart T_EXShop .

6 Extending Processing via Engines

T_EXShop offers several default "engines" (also referred to as "scripts" which is left over from earlier times) in its Typeset Menu. These include running Plain TeX or LaTeX (either using pdftex or TeX+DVI), BibTeX, MakeIndex, MetaPost or ConTeXt. But there are many things you may wish to do that fall outside of this limited set so T_EXShop also allows you to create new engines that are stored in ~/Library/TeXShop/Engines. These additional engines do not show up in the Typeset menu but only in the popup list on the Source and Preview Toolbar (see Figure (12) on page 14).

You can use these engines by choosing from that popup list and then pressing the Typeset button or, a better choice if you use different engines for different documents, by putting a line like

% !TEX TS-program = xelatex

at the top of your source file; the example given will run the xelatex engine on this file independent of other choices. You can override the choice you make in the line with one of the basic engines (e.g., run BibTeX) by using the items in the Typeset Menu directly.

TEXShop is shipped with a few engines activated (i.e., directly in the ~/Library/TeXShop/Engines folder) but also includes several additional ones in ~/Library/TeXShop/Engines/Inactive. As an example let's activate and use the pdflatexmk engine found in ~/Library/TeXShop/Engines/Inactive/Latexmk.

6.1 The pdflatexmk engine

If your document has cross-references, bibliographies and/or indexes it takes multiple pdflatex runs with intermediate runs of bibtex and/or makeindex to create the bibliographies, indexes and resolve all cross-references. The pdflatexmk engine automates this whole process.

TEXShop 3.07 or 2.46 and later activate the pdflatexmk engine by default *in a fresh installation*. If you are using an earlier version of TEXShop, or even updated to the latest version from an earlier version, you need to activate the engine. To activate the engine simply move the pdflatexmk.engine file from ~/Library/TeXShop/Engines/Inactive/Latexmk two folders up, to

~/Library/TeXShop/Engines. When you restart T_EXShop you can check that pdflatexmk is now in the popup menu.

Then place the line

% !TEX TS-program = pdflatexmk

at the top of your source file. From then on when you simply typeset the file (Typeset \rightarrow Typeset or Cmd-T) T_EXShop will use this engine and the complete process of typesetting the document to its final form will be carried out.

Appendices

A — Command Completion Tables

The following tables contain the Command Completions and Abbreviations included by default with TeXShop. Table 1 on page 16 is a list of all included environment abbreviations. Table 2 on page 17 lists included abbreviations/completions for commands and declarations. Finally, Table 3 on page 18 are the included abbreviations for greek letters.

It is important to remember that with a given abbreviation successive presses of the trigger key go to the next match in the list. E.g., there are three sectioning commands, sec for the standard section command, secs for the "starred" version of the command and seco for the version with an optional argument; if you enter sec as your abbreviation successive presses of the trigger goes from the sec to the secs to the seco versions before returning to your original abbreviation. That means there are many abbreviations that you never need to remember.

Note: do *not* attempt to memorize these tables. Learn a few items that you use all the time and then slowly add to your knowledge as you need them.

Table 1: Environment abbreviations.

Abbreviation	Environment	Abbreviation	Environment
barr	array	blett	letter
babs	abstract	blist	list
bali	align	bminp	minipage

Table 3: Greek Letters. The 'd' versions are not shown.

Abbreviation	Command	Abbreviation	Command
xa	alpha	xvp	varpi
xb	beta	xph	phi
xch	chi	xcph	Phi
xd	delta	xvph	varphi
xcd	Delta	xps	psi
xe	epsilon	xcps	Psi
xve	varepsilon	xs	sigma
xet	eta	xcs	Sigma
xg	gamma	XVS	varsigma
xcg	Gamma	XZ	zeta
xio	iota	xr	rho
xk	kappa	xvr	varrho
xl	lambda	xt	tau
xcl	Lambda	xth	theta
xm	mu	xcth	Theta
xn	nu	xvth	vartheta
xo	omega	xu	upsilon
xco	Omega	xcu	Upsilon
xp	pi	XX	xi
xcp	Pi	XCX	Xi
